## LABORATORY MICROBIOLOGY & ANTIMICROBIAL SUSCEPTIBILITY REPORT

|                      |                              |                      |                  |
|----------------------|------------------------------|----------------------|------------------|
| Patient Name:        | Rajesh Chopra                | Specimen ID:         | ACC-2026-00010   |
| MRN:                 | MRN-2026-1011                | Order ID:            | ORD-MIC-1010     |
| Patient ID:          | PAT-0011                     | Specimen Type:       | Urine            |
| Age / Sex:           | 67 Y / Male                  | Collected Date/Time: | 2026-08-06 00:00 |
| Admitting Diagnosis: | Community-Acquired Pneumonia | Received Date/Time:  | 2026-08-06 00:45 |
| Report Status:       | FINAL                        | Reported Date/Time:  | 2026-08-08 04:00 |

### I. PRIMARY SPECIMEN EXAMINATION & CULTURE FINDINGS

|                             |                                                                                                  |
|-----------------------------|--------------------------------------------------------------------------------------------------|
| Direct Smear / Microscopy:  | Budding yeast cells and pseudohyphae observed. Few pus cells.                                    |
| Culture Growth Result:      | Significant Pure Growth: > 10 <sup>5</sup> CFU/mL isolated on selective and non-selective media. |
| Isolated Organism:          | <b>Candida albicans</b>                                                                          |
| Resistance Classification:  | SUSCEPTIBLE                                                                                      |
| Identification Methodology: | Automated Microbial Identification (VITEK 2 GN/GP & MALDI-TOF Mass Spectrometry)                 |

### II. ANTIMICROBIAL SUSCEPTIBILITY TESTING (AST) — CLSI M100 CRITERIA

| Antimicrobial Agent | MIC / Value   | Interpretation  | CLSI Category |
|---------------------|---------------|-----------------|---------------|
| Fluconazole         | <= 0.5 ug/mL  | Susceptible (S) | S             |
| Voriconazole        | <= 0.06 ug/mL | Susceptible (S) | S             |
| Posaconazole        | <= 0.06 ug/mL | Susceptible (S) | S             |
| Caspofungin         | <= 0.25 ug/mL | Susceptible (S) | S             |
| Micafungin          | <= 0.06 ug/mL | Susceptible (S) | S             |
| Amphotericin B      | 0.50 ug/mL    | Susceptible (S) | S             |

### III. INTERPRETATION & CLINICAL REMARKS

**Interpretation:** Isolated strain of **Candida albicans** exhibits standard wild-type susceptible antimicrobial profile. No high-level or extended-spectrum acquired resistance detected. Therapy should be directed based on documented clinical susceptibility and site of infection.

### IV. LABORATORY AUTHORIZATION & AUTHENTICATION

|                                                                           |                                                                                |                                                                                          |
|---------------------------------------------------------------------------|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
